

# Oklahoma Farm and Ranch Custom Rates, 2011-2012

Damona Doye

Regents Professor and Extension Economist

Roger Sahs Extension Assistant Specialist

This Current Report summarizes data collected from Oklahoma farmers, ranchers and custom operators during the summer of 2011. Custom work is defined as machine

operations performed for the customer with the custom operator furnishing the machine, fuel, labor and other inputs directly associated with the machine. Custom operators do not usually furnish materials such as seed or fertilizer unless it is explicitly stated. In general, custom rates have increased since the 2009 survey. Approximately 210 surveys were returned with usable data.

### **Summary Procedure**

The rates quoted herein were collected by a survey of both farmers and custom operators. A list of over 150 operations was provided from which each respondent quoted rates for only selected operations. Some respondents quoted rates for only one or two operations while others were familiar with rates for many of the machines listed. "Fair" rates are negotiated. Regional or state average rates may be used as a beginning point for discussion. However, differences in operations, requirements, and circumstances may impact rates.

The rates summarized on the inside pages were edited to remove those replies for which the respondent's interpretation of the information being requested did not match the interpretation of other respondents.

## Interpreting the Rate Tables

A statewide rate summary for each operation is quoted in the included table. If available, separate quotes are listed for each area of the state as shown in the map. The number of estimates obtained, the average rate, and the lowest and highest rates reported are shown. The cost of following up with individual surveys prohibited questioning or affirming doubtful replies. In most cases the number of observations was insufficient to allow statistical analysis. In general, large numbers of observations improve reliability. You must interpret these results, therefore, with these limitations in mind.

Figure 1 shows the distribution of survey responses for operations with at least 30 observations. For example, a distribution of 93 responses for baling large round bales is one

of several graphs shown. None of the respondents reported a rental rate less than \$8 per acre, 19% reported a rental rate between \$8 and \$11.49 per acre, 26% reported a rental rate between \$11.50 and \$14.99 per acre, 26% reported a rental rate between \$15 and \$18.49 per acre, 14% reported a rental rate between \$15.0 and \$21.99 per acre, and 15% of the respondents reported a rental rate of \$22 or more per acre.

If you are interested in a rate quotation for a specific operation in an area which shows a small number of reports, consider rates for other areas of the state where the operation is more common or refer to the statewide summary. Additional adjustments for field size and soil type may be necessary.

## **Reporting Regions**

Area rates are summarized for the State of Oklahoma as shown in the map above. Regional differences are apparent in the rate table with higher rates prevailing when:

- Fields are small.
- Soils are heavy.
- Slopes are steep.
- Machines are scarce.
- Custom operators are not available.

Rates tend to be lower than expected when exchange work is common between relatives and neighbors. Under these

#### Figure 1. Relative frequency of responses for selected operations, 2009-2010.

circumstances, fixed costs of ownership such as depreciation and interest on investment (sometimes even labor) tend to be discounted when a rate is established for a particular job.

## **Custom Service vs. Ownership**

Individual circumstances–cash flow, ownership and operating costs, labor availability, reliability and timeliness of custom operators, pride of ownership–will influence an individual's decision on whether to buy or lease machinery and equipment or custom hire work done. A worksheet at the end of this article is designed to help evaluate the cost of machinery ownership and operation. Software to help evaluate the cost of owning and operating farm machinery is available online at agmach.okstate.edu.

## Possible Advantages of Using Custom

## Operations

- Ownership costs are avoided.
- Capital and labor can be channeled to other uses.
- Machine use can be readily adjusted to changes in crop mix and market conditions.
- Specialized operations may benefit from experience and skilled operator.
- Jobs may be completed faster using several machines.

## Possible Disadvantages of Using Custom Operations

- Service may not be available at the best time.
- Reliability of the custom operator may not be known.
- Rates may be excessive in special situations.

Each manager must choose the best combination of owned and hired machines. The quotations here will be helpful in estimating custom costs and to provide a base figure for agreement on a rate when well established local rates are not available. If you have questions, ask your Extension Educator- Agriculture or Area Agricultural Economics Specialist for additional information.

## **Considerations to Keep in Mind**

Keep in mind there is a wide variation in rates charged for most jobs, even within the same geographic area, partly because some custom work is done for friends, relatives, and neighbors at reduced rates, partly because *some* custom work is done late by farmers who do their own work first and therefore do not attempt to include the full cost of machine ownership in their rates, and partly because it is easy to under-estimate the full cost of ownership and operation of machinery.

A small number of reports for a given machine in a particular area may not be representative. In this case, it is particularly important to check rates in other areas or statewide where a larger number of reports are found.

## **Costs of Ownership and Operation**

The management decision to own a machine, to custom hire operations performed, or to custom perform operations is partially determined by cost, which is heavily influenced by the amount of use realized over the period of machine ownership. Estimates of fixed and variable costs per hour can be approximated using the following steps. Unless accurate records are used to estimate costs, variability in machine and operator efficiencies can cause actual results to be significantly different from estimated results.

Α.	Acres per hour = Acres covered in normal day $\div$ hours in normal day		acres ÷	hou	urs =		
В.	Average investment = (Original cost + Trade-in value) $\div$ 2 =	(\$		_+\$	) ÷ 2	= \$	
C.	AnnualOriginal cost – Trade-in valueDepreciation=Number of years owned= (\$		- \$	)÷	years	= \$	
D.	Annual Interest = Average Investment x Interest rate = \$		x	%		= \$	
E.	AnnualPersonalTaxes = Average Investment xTax rate (1) = \$		x	9	, 5	= \$	
F.	Annual Insurance Insurance = Average Investment x rate (2) = \$		x		%	= \$	
G.	Total Annual Ownership Costs (Sum of C through F)					= \$	
Н.	Ownership Annual Acres   Costs per acre = Ownership Costs ÷ Per Year = \$		÷	acres	/year	= \$	
I.	RepairsAcresPer acre = Repairs (3) ÷ Per Year= \$	÷		icres/year		= \$	
J.	Fuel Cost   Fuel   Gallons   Acres     Per acre   =   Price   x   Per Hour   +   Per Hour   = (\$	/gal. x	gal./h	our) ÷	_acres/hour	= \$	
K.	Labor costs Daily Acres Per acre = Wage ÷ Per day = \$	/day ÷		acres/day		= \$	
L.	Total Cost Per Acre = Sum of items H through K above					= \$	

(1) Use local tax rate if known. One to two percent is a reasonable "guesstimate".

(2) Use own insurance rate if known. One-half to one percent is a reasonable "guesstimate".

(3) Use your repair expense data, if available. One percent of original price for each year machine is kept is a rough estimate; e.g., 10% per year if machine is to be used for 10 years.

## The Oklahoma Cooperative Extension Service Bringing the University to You!

The Cooperative Extension Service is the largest, most successful informal educational organization in the world. It is a nationwide system funded and guided by a partnership of federal, state, and local governments that delivers information to help people help themselves through the land-grant university system.

Extension carries out programs in the broad categories of agriculture, natural resources and environment; family and consumer sciences; 4-H and other youth; and community resource development. Extension staff members live and work among the people they serve to help stimulate and educate Americans to plan ahead and cope with their problems.

Some characteristics of the Cooperative Extension system are:

- The federal, state, and local governments cooperatively share in its financial support and program direction.
- It is administered by the land-grant university as designated by the state legislature through an Extension director.
- Extension programs are nonpolitical, objective, and research-based information.

- It provides practical, problem-oriented education for people of all ages. It is designated to take the knowledge of the university to those persons who do not or cannot participate in the formal classroom instruction of the university.
- It utilizes research from university, government, and other sources to help people make their own decisions.
- More than a million volunteers help multiply the impact of the Extension professional staff.
- It dispenses no funds to the public.
- It is not a regulatory agency, but it does inform people of regulations and of their options in meeting them.
- Local programs are developed and carried out in full recognition of national problems and goals.
- The Extension staff educates people through personal contacts, meetings, demonstrations, and the mass media.
- Extension has the built-in flexibility to adjust its programs and subject matter to meet new needs. Activities shift from year to year as citizen groups and Extension workers close to the problems advise changes.
